When I was recently at Opal Marine they said you had to fit a plate to the top of the mast to hold the sensor. Has anyone any knowledge of fitting this and any tips for fitting the whole wind instrument.

**Replies:**

I wonder if the following two pictures will help - they were taken of the top of my B34's mast (before it was raised).

At the masthead I fitted two marine aerials, a masthead tricolour incl. all-round white and a Raymarine wind sensor.

As the top of the mast is not horizontal but slopes towards the front it was necessary to mount the tricolour and wind sensor to an aluminium plate to bring them level.
